

Adventure Game Enhancements Report

Overview:

The original text adventure was transformed into a richer, replayable browser game with branching outcomes, animated endings, and relatable scene imagery.

Enhancements Implemented:

- 1) Added replayable branching flow with clear win/lose outcomes.
- 2) Added inventory progression concept (rusty key, ancient map, lit torch).
- 3) Built immersive full-screen interactive HTML UI.
- 4) Replaced abstract visuals with relatable photo-style scene tiles in a local assets folder,
 - with distinct images for each major option and outcome:
 - Intro and crossroads
 - Forest choice, river outcome, and tree outcome
 - Cave choice, dark-route loss, and torch-route progress
 - Locked gate branch and treasure-win branch
- 5) Added animated outcome screens:
 - Win: Treasure chest celebration animation.
 - Lose: Game over pulse animation with retry option.
- 6) Added guided player input, status updates, and restart controls.

Challenges Faced:

- Making images feel realistic while keeping the game lightweight.
- Ensuring overlaid text remains readable on bright/dark photos.
- Preserving a consistent look across different scene backgrounds.

Resolution Approach:

- Used large background scene photos with a dark gradient overlay.
- Added reusable tile styling so all steps feel cohesive.
- Generated report via matplotlib PDF export for broad compatibility.

Outcome:

The game now feels more relatable and story-driven, with scene visuals that better match player decisions and adventure context.
